

Linguistics 288b

Phonology 5

Allomorphy

- Morphemes, like phonemes, are not always realized in the same way in all contexts.
- We talk about allomorphs just as we talk about allophones.
- But the factors that determine the distribution of allophones are purely phonological; the conditioning of allomorphy is determined by a wider range of factors.

Linguistics 288b 2

Allomorphy

- Allomorphy is typically governed by one of three kinds of conditioning:
 - **Phonological conditioning**
 - **Grammatical conditioning**
 - **Lexical conditioning**

Linguistics 288b 3

Phonological conditioning

- The choice of an allomorph for a particular morpheme is determined by the local phonological context.
- E.g. English plural

Linguistics 288b 4

Allomorphy

- English plural: an illustration of phonologically-conditioned allomorphy.

plural /z/:

[kæt s]	→	Allomorphs of plural /z/
[dæg z]	→	
[bʌ s əz]	→	

Linguistics 288b 5

Grammatical conditioning

- The choice of allomorph is determined by the grammatical environment in which the morpheme occurs.

Linguistics 288b 6

Grammatical conditioning

- Mid-vowel laxing in Portuguese nouns

Singular	Plural
olho [oʎu] 'eye'	olhos [oʎuz] 'eyes'
ovo [ovu] 'egg'	ovos [ovuz] 'eggs'
povo [povu] 'people'	povos [povuz] 'peoples'

Linguistics 288b

7

Portuguese nouns

- The tenseness of the vowel in the root is determined by whether the plural affix is attached or not.

Linguistics 288b

8

Grammatical conditioning

- German adjectives:
 - **ein gross-er Wagen** 'a big car (masculine)'
 - **ein gross-er Fisch** 'a big fish (masculine)'
 - **ein gross-es Haus** 'a big house (neuter)'
 - **ein gross-es Tier** 'a big animal (neuter)'
 - **eine gross-e Feder** 'a big feather (feminine)'
 - **eine gross-e Schlange** 'a big snake (feminine)'

Linguistics 288b

9

German adjectives

- The suffix on the adjective is not determined by the phonetic shape of the base or of the next word, nor is it determined by the particular lexeme following, but rather by the grammatical gender class that lexeme belongs to.

Linguistics 288b

10

Lexical conditioning

- The choice of the allomorph is determined by the presence of a specific lexical item (i.e. determined by the choice of the word to be marked).
 - **e.g. English plural (again)**

Linguistics 288b

11

Lexical conditioning: English plural

dog		dogs
cat		cats
ox	oxen	?oxes
tooth	teeth	*tooths

Linguistics 288b

12

English plural

- There are distinct (i.e. not phonologically related) allomorphs of plural that are required by certain lexical items.
- Notice that phonologically conditioned allomorphy operates on specific bundles of phonological material, while grammatical and lexical conditioning may relate forms that are totally unrelated from a phonological perspective (e.g. suppletion).

Linguistics 288b

13

Morphophonemics

The study of the interface between phonology and morphology

English plural revisited

dog	dogs	[dɔgz]
cat	cats	[kæts]
rose	roses	[rɔwzəz]
tree	trees	[tri:z]

Linguistics 288b

15

English plural revisited

1. [s] after non-strident voiceless segments
 - /kæt + z/ = [kæts]
 - /kæp + z/ = [kæps]
2. [z] after non-strident voiced segments
 - /dɔg + z/ = [dɔgz]
 - /bɪj + z/ = [bɪjz]
3. [əz] after strident segments
 - /bʌ s + z/ = [bʌ səz]

Linguistics 288b

16

English plural

- NB: these are not rules but **descriptions** of the environments in which [s], [z] and [əz] are found.
- Three allomorphs of plural: [s] [z] [əz].
- Which should we pick as the underlying representation?

Linguistics 288b

17

English plural

- [əz] is the most restricted, since it only occurs after stridents. Therefore we expect this to be a form derived by rule.
- In the case of the other two, it is less clear.

Linguistics 288b

18

English plural

- Since [z] has the widest distribution, we posit that /z/ is the underlying form.
- How do we get from the underlying form to the different allomorphs?

Linguistics 288b

19

English plural

- The description results from the application of **two rules**.

Linguistics 288b

20

1. Schwa-epenthesis

- in segments:
 $\emptyset \rightarrow [\emptyset] / [s z \int ʒ tʃ dʒ] _ [z]$
- in words: [ə] is epenthesized between stridents and [z]
e.g. /bʌ sʒz/ → [bʌ səz]
strident epenthetic [ə]

Linguistics 288b

21

2. /z/-devoicing

(or assimilation of voice)

- in segments:
 $/z/ \rightarrow [s] / [p t k f \theta] _$
- in words: /z/ becomes [s] after voiceless consonants

Linguistics 288b

22

/z/-devoicing

NB: /z/-devoicing is **assimilation** of [-vce]

Linguistics 288b

23

English plural

- Question: which process comes first?
- Does it matter?

Linguistics 288b

24

Sample derivation

UR:	/kæt/+z/	/dag/+z/	/rowz/+z/	/hɔrs/+z/
ə-insertion	n/a	n/a	rowzəz	hɔrsəz
devoicing	kæts	n/a	n/a	n/a
Output:	[kʰæts]	/dagz/	[rowzəz]	[hɔrsəz]

Linguistics 288b 25

Sample derivation

UR:	/kæt/+z/	/dag/+z/	/rowz/+z/	/hɔrs/+z/
devoicing	kæts	n/a	n/a	hɔrss
ə-insertion	n/a	n/a	rowzəz	hɔrsəs
Output:	[kʰæts]	/dagz/	[rowzəz]	[hɔrsəs]

Linguistics 288b 26

English plural

- What if we pick /s/ as the underlying form?
- In the case of this process, it is possible to derive the correct outputs whichever UR we choose to start with.
- We use slightly different rules, but the results are the same.

Does this mean it never matters which underlying representation we pick?

Linguistics 288b 27

Samoaan

Intrans V	Trans V	Gloss	Nominal
inu	inumia	'drink'	inumaja
taji	tajisia	'weep'	tajisaja
sila	silafia	'see'	silafaja
sio	siomia	'surround'	siomaja

Linguistics 288b 28

Samoaan

- What would you hypothesize as the underlying form for the suffix that derives a transitive verb?
- What about the suffix that derives a nominal form of the verb?

Linguistics 288b 29

Samoaan

How do we explain the apparent similarity between the initial consonants of the transitive and nominal suffixes?

Intrans V	Trans V	Gloss	Nominal
inu	inu-mia	'drink'	inu-maja
taji	taji-sia	'weep'	taji-saja
sila	sila-fia	'love'	sila-faja

How do we explain the different initial consonants of the transitive suffix?

Linguistics 288b 30

Samoan

- The most straightforward analysis is to assume that there is a final consonant in the root morpheme.
- We get a uniform treatment of the affixes if we suppose that the consonants are part of the root, not part of the suffixes.
- We also explain why the same consonant occurs with both suffixes for a given root.

Linguistics 288b

31

Samoan

Intrans V	Trans V	Nominal
inum	-ia	-aŋa
taŋis	We can postulate a phonological rule that deletes a word-final C: $C \rightarrow \emptyset / _ \#$	
silaf		
siom
